## Award of Kampumba License

### HIGHLIGHTS

- The Kampumba exploration license LPL385 covers an area of 443 km<sup>2</sup>.
- Geochemical surveys in the mid 1970's identified several base metal soil anomalies.
- Potential for the discovery of major new copper-gold-silver-lead-zinc polymetallic ore deposits exists.
- A soil geochemistry survey will commence shortly over prospective zones in an area of 80 km<sup>2</sup>.

Londoloza Resources Corporation (LRC) is pleased to announce the acquisition of a new exploration license in Zambia. The Kampumba exploration license LPL385 covers an area of 443 km<sup>2</sup> and is situated 12 kms due east of LRC's existing Iron Cap Small Mining License SML 177. The license lies immediately east of Zambezi Resources' Mulungushi license (PLLS224) and encloses license PLLS 131 held by Katanga Resources (a subsidiary of African Eagle plc).

Kampumba is situated close to the Mwembeshi Shear zone, an area of known prospectivity for gold and base metals. Exploration in the region has identified several zones of gold and base metal enrichment along an east-west trending zone of Muva Group metasediments and mafic volcanics. Geochemical surveys by Mindeco Noranda Limited in the mid 1970's identified several base metal soil anomalies on Kampumba and adjacent areas but these were not investigated further.

Based on a thorough analysis of available exploration information Londoloza will focus its initial prospecting efforts on prospective zones identified within an 80 km<sup>2</sup> block in the south-western part of the Kampumba license. Londoloza plans to begin a soil geochemical survey of this area within the next 6 weeks.

Early exploration by Zambezi Resources on their Mulungushi license immediately west of Kampumba has yielded promising results: rock chip samples from their "Iron Cap South" prospect returned 1.58% Cu, 0.28g/t Au and 12g/t Ag; from the Kamona prospect 1.02% Cu, 3.86% Au and 21.4g/t Ag.

Londoloza's Kampumba license is ideally placed in an area with significant potential for the discovery of major new copper-gold-silver-lead-zinc polymetallic ore deposits and greatly enhances the value of LRC's portfolio of exploration properties in Zambia.
